This extensions uses OID .1.3.6.1.2.1.25.5.1.1.1 to walk the list of active processes on the host.

As usual you have to create a service in Nagios, and the only parameter needed is $HOSTNAME$.

Create an item in your map and choose "code" and the code to display is iframe.php which will in turn get its info from tabledisplaysql which itself get its info from the MySQL database.

The info is put in the database by myscript.pl which is the script that should live in /usr/local/nagios/libexec, quite simple really.
